Introduction
We have already established that COVID long haulers tend toward Chronic Kidney Disease (CKD) that leads to Anemia (or low Iron). The loss of Iron may lead to cancer.

Note the following balanced chemical equation involving iron and hydrogen peroxide:
\[2 \text{Fe(OH)}_3 \rightarrow \text{Fe}_2\text{O}_3 + 3 \text{H}_2\text{O}\]

We have established that cancer may be caused by hydrogen peroxide. This is simply hydroxide (OH-). In the equation, we see that low iron mean a surplus of OH- (hydroxide) that is fuel for a cancer to develop. I expect cancer rates to rise among the long haulers after COVID-19. We are fortunate to see researchers who have developed a new blood test to detect 50 types of cancer. It comes in the nick of time [1-3].

The future is brighter for cancer sufferers. I suspect a cure for cancer involves simply Hydrogen to reduce hydroxide to water. I’m hoping someone who does experimental research to take up the torch and see if hydrogen is a cure of this plague that has scourged humanity.
